2) Obesity & Public Health Crisis

- WHO's recent data showing significant global rise in obesity highlights public health, healthcare cost, and corporate wellness program strategies.
- A diagnosis of overweight or obesity is made by measuring people's weight and height and by calculating the body mass index (BMI): $\text{weight (kg)} / \text{height}^2 (\text{m}^2)$. The body mass index is a surrogate marker of fatness and additional measurements, such as the waist circumference, can help the diagnosis of obesity.
